Question:

With ACUCOBOL-GT my program used the A4GL_WHERE_CONSTRAINT external variable in order to add further constraints to the SQL SELECT statement generated for the COBOL START statement.Â

For example,

```
Move "fctest_key > 3 and fctest_key      A4GL_WHERE_CONSTRAINT.  
Inspect A4GL_WHERE_CONSTRAINT replacing trailing spaces by  
      low-values.  
START FTEST-FILE KEY NOT LESS FTEST-KEY.  
How can I accomplish the same thing in isCOBOL?Â
```

Answer:

You can set the external variable EDBI-WHERE-CONSTRAINT, that works the same way as A4GL-WHERE-CONSTRAINT.
